

Information Sheet

Expressing breastmilk by hand

If more information is required please don't hesitate to ask your Midwife, Doctor or Maternal & Child Health Nurse

It is important to learn how to hand express your breastmilk prior to going home from hospital. The midwives will help you to do this.

WHY EXPRESS YOUR MILK?

- ❖ If your breasts are full and uncomfortable
- ❖ To soften the breast to help your baby to attach
- ❖ To give your baby expressed milk if they are small or sick
- ❖ If your milk supply is low
- ❖ To clear blocked areas or mastitis
- ❖ To continue milk flow during mastitis
- ❖ If you are going back to work or
- ❖ If you need to be away from your baby for a period of time (e.g. Special event)

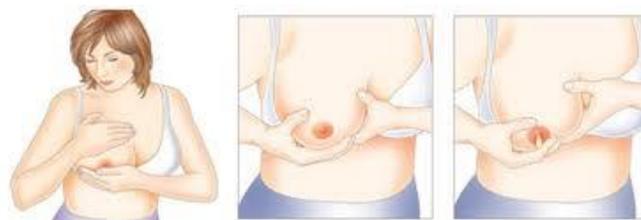

HOW TO HAND EXPRESS YOUR MILK?

TIP Wash your hands thoroughly prior to expressing your breastmilk

To begin with you will need to stimulate your milk to flow:

- ❖ Make yourself comfortable, so you are as relaxed as possible
- ❖ Have your baby close, or a photo if this is not possible
- ❖ Use warm compresses or have a warm shower
- ❖ Gently massage your breast to stimulate the letdown of milk by – rolling your nipple between your finger and thumb and gently stroking your breast towards your nipple.

HOW TO EXPRESS BY HAND

- ❖ Place your thumb and forefinger on the opposite sides of the nipple at about the border of the areola
- ❖ Press the finger and thumb together towards the chest without sliding the fingers on the skin and gently compress
- ❖ Release the pressure and then repeat, creating a similar rhythm to a sucking baby
- ❖ When the flow stops move your fingers to another spot, around the edge of the areola, and begin again
- ❖ When the flow decreases to only a few drops of milk change to the other breast
- ❖ Massage both breasts again and repeat the above steps

TIP At first you may only get a few drops, but keep going and with practice and time milk will flow more easily.

HOW LONG WILL IT TAKE TO EXPRESS?

Breast milk expression will most likely take between 20 and 30 minutes all together.

Importantly express one breast until the milk flow slows to drips and then change to the other breast. If you are expressing for **low milk supply**, you can change back to the first breast again.

Information Sheet

Expressing breastmilk by hand

Going back and forth expressing both breasts will eventually increase your milk supply.

HOW MUCH MILK SHOULD YOU BE ABLE TO EXPRESS?

The amount of milk you will get varies and is dependent on individual circumstances and the stage of breastfeeding.

In the early days a few drops to a few mls of colostrum may be expressed each time. Then as your milk changes from colostrum to more mature milk this amount increases and by day five this may be around 50-70 mls increasing to 80-120mls by the end of the first week.

Everyone is different and these amounts will vary from mother to mother, if you have any concerns about your milk supply, not being enough to feed your baby please ask for help.

Tips

- ❖ Hand expressing should be used in the first few days post birth (before your milk comes in) you may choose to use a pump after your colostrum changes to more mature milk.
- ❖ Hand express a little milk before a feed if your breasts are very full, so baby can attach well.
- ❖ If for any reason your baby is unable to breastfeed express as soon as possible after birth-frequent expressing (8-10 times in 24 hours including overnight) will help to establish and maintain your milk supply.

For more information and advice contact your local Midwife or Maternal & Child Health Nurse.

Guidelines for storage of breastmilk at home

Breastmilk Status	Room Temperature (24degrees or lower)	Refrigerator (4 degrees or lower)	Freezer
Freshly expressed into container	6-8 hours. If refrigerator is available store milk there.	3-5 days. Store at the back where it is coldest.	2 weeks in freezer compartment inside refrigerator. 3 months in freezer section of refrigerator with separate door. 6-12 months in deep freeze (-18 degrees)
Previously frozen, thawed in refrigerator but not warmed	4 hours or less - that is, the next feeding	24 hours	Do not refreeze
Thawed outside refrigerator in warm water	For completion of feeding	4 hours or until next feeding	Do not refreeze
Infant has begun feeding	Only for completion of feeding	Discard	Discard
